

City of Andover Emerald Ash Borer Management Plan/Program

(updated December 2024)

PURPOSE

The City of Andover supports a proactive approach to identifying and planning for Emerald Ash Borer (EAB) infestations to help spread the costs over a manageable time period and limit the detrimental effect on property value, quality of life and the environment.

APPLICABILITY

This management plan is applicable to all public and private properties within the City.

EAB COORDINATOR

The Natural Resources Technician (NRT) shall be responsible for implementing and overseeing this program.

HISTORY OF EAB

EAB (*Agilus planipennis*) is an introduced pest that has been confirmed in 35 states, including Minnesota, and five (5) Canadian provinces. It was first discovered near Detroit, Michigan in July 2002. Since its initial finding, millions of ash trees have died and it's cost states, municipalities, nurseries, forest industries and property owners millions of dollars.

EAB attacks all species of ash trees (*Fraxinus* spp.) found in Minnesota, which include green ash (*Fraxinus pennsylvanica*), black ash (*Fraxinus nigra*) and white ash (*Fraxinus americana*). Minnesota is home to more than 900 million ash trees statewide. Mountain ash are not of the *Fraxinus* genus, so are unaffected by EAB.

By the end of 2021, EAB had been confirmed in thirty (30) Minnesota counties. As of July 2015, it's also been found in Anoka County, as it was found in Ham Lake in March of 2015. **It was first found in Andover in August of 2016.**

While the adult beetles feed on ash leaves and do little damage, the larvae feed on the inner bark of trees, disrupting its ability to transport water and nutrients up to the canopy. As the number of larvae in a tree increases, less water and nutrients reach the canopy, resulting in dieback in the canopy. Initial attacks tend to be in the upper portions of the canopy. By the time visible symptoms are obvious, the population of EAB has grown and likely spread to other ash trees in the area.

RECOGNITION OF EAB

Signs/symptoms of EAB that can help detect an infestation include:

- Increased woodpecker activity/damage
- Bark splitting (vertical slits)
- Canopy dieback
- D-shaped exit holes created by adult insects as they emerge from the tree
- Epicormic branching/shoots near base of tree
- Serpentine (s-shaped) larval galleries that are packed with frass

EDUCATION

The City will continue to educate residents and elected officials concerning EAB using newsletter articles, segments on QCTV, the website and public and group presentations.

TRAINING

The NRT will stay informed about EAB outbreaks and research, including outcomes of various biological controls. City staff will be trained by the NRT to aid in City planning, responsible tree removal and disposal, treatments and coordination of City response.

INVENTORY

A local ash tree inventory will allow the City to determine what is at stake, help determine which areas should rank as priority management areas and help with overall planning efforts.

The NRT continues to record GPS locations of ash trees while in the field. Data collected includes but is not limited to number of trees, size, condition and management activities taken.

Conducting a broader sample survey or complete inventory provides these benefits:

- Provide the percentage of public and private trees that consist of ash species
- Help plan for budget impacts for removal and replacement of trees
- Locate priority areas for tree management plans and potential treatments
- To forecast potential impacts of infected trees on private property
- Estimate volume of wood potentially requiring disposal
- Identify homeowner associations that may benefit from education and planning

DETECTION AND MONITORING

Staff will continue to inspect public and private properties, both on request and during routine inspections. Suspect trees will be carefully analyzed. Sampling mechanisms to be used will be consistent with Minnesota Department of Agriculture (MDA) guidelines and will include but not be limited to visually looking at all parts of the tree, branch removal and bark shaving with a drawknife. If staff detects an early infection which is limited to a few trees, the City may encourage tree removal to slow the rate of spread.

ORDINANCE

The City revised its diseased tree ordinance to include EAB as a threat to the urban and community forest in May 2016. The ordinance amendment specifies requirements for proper management of EAB infested trees.

ASH TREE REMOVAL

- Public trees (as authorized by the EAB Coordinator):
 - Any park tree in a landscape setting infected with EAB may be removed*
 - Trees in wooded areas in a park that are positively infected with EAB and deemed a safety hazard will be removed. All other cases will be looked at on a case by case basis
 - Any park tree may be removed, if determined appropriate; reasons may include under power line, safety hazard, near infection center, etc.
- Private trees:
 - EAB Coordinator will advise property owners of available options. Details on removal requirements are specified in approved diseased tree ordinance.
 - Any boulevard tree found to be positively infected with EAB may be removed*

**These trees may be treated as an alternative if they meet certain criteria; details under “Chemical Treatments”*

TREE DISPOSAL AND UTILIZATION

Approved options for proper disposal of wood positively infected with EAB:

- Transporting the wood to an approved disposal site; statewide quarantines shall be respected
- Chipping the wood to dimensions no greater than 1” x 1” x 1”
- Burning
- De-barking (removing all bark and at least 0.5” of outer wood)
- Treatment (including heat treating, kiln drying, fumigating, seasoning or another method approved by the MDA)

The NRT will continue to seek creative, cost effective ways to utilize ash trees. Examples may include finding a small scale logger who has a special market for ash or a property owner with a sawmill who makes unique products out of ash.

PLANTING

Ash are no longer planted on public properties or recommended to be planted on private properties. Ash trees have been removed from the “City of Andover Tree Planting Recommendations” handout.

Staff will encourage planting other species. Native species found from common seed sources are highly recommended. The City will also plant a variety of species, as diverse plantings reduce impacts of insect or disease outbreaks.

CHEMICAL TREATMENTS

Starting with the growing season of 2017, the City has been coordinating an annual Ash Injection Program-utilizing the approved chemical Emamectin Benzoate. A City contractor continues to be hired to help give property owners an opportunity to have trees treated under a City contract. The per diameter inch rate is very competitive and the City also offers an additional “Bonus City Discount” for select, eligible trees. Trees have to have less than or equal to 25% crown dieback. Right-of-way trees can be treated, but cost is to be covered by adjacent property owner. In addition, the City continues to treat some high value, specimen public trees under the contract. The City will continue this program into the future.

Aside from the Ash Injection Program, the EAB Coordinator will continue to provide consultation and information to help property owners devise treatment plans, as requested. Information will include the handout “Homeowner Guide to Insecticide Selection, Use and Environmental Protection.” Staff will advocate for responsible application of chemicals. For chemicals that require professional application, only Certified Pesticide Applicators shall be recommended.

BUDGET

The City Natural Resources Preservation Fund allows for spending on EAB prevention and treatment measures. This primarily covers the City portion of the “Bonus City Discount” for private properties and the cost to treat public trees under the Ash Injection Program. The NRT will continue to seek grant opportunities to help fund this plan.

PARTNERSHIPS/CURRENT ACTIVITIES

The City will continue to work with the MDA, DNR, Minnesota Shade Tree Advisory Committee (MnSTAC) and neighboring communities.

The NRT was a board member of MnSTAC and as chairman of the Forest Health Committee in 2011, hosted a discussion on EAB for communities around the state. In addition, the NRT was President of the Minnesota Society of Arboriculture (MSA) from 2020-2021.

SUMMARY

EAB is a serious threat to Andover’s urban and community forest. Now that it’s here, the City is proactive and is implementing this EAB Management Plan/Program to the extent feasible. This management plan is dynamic and subject to revision(s) as new information about EAB becomes available and/or as new treatment options are identified. Furthermore, this plan is also subject to revision should state and/or federal policies necessitate plan updates.

FUTURE TASKS/GOALS

- Update City staff and City Council on any new developments as needed
- Continue to meet with neighboring communities and forestry partners as needed
- Continue inventory
- Remove hazardous ash trees in City Parks
- Notify property owners to remove hazardous ash trees in boulevards
- Coordinate Andover Ash Injection Program
- Prepare and disperse educational materials on EAB for public events, newsletter & website
- Have booth and/or presentation at Home Show and “Tree Time” event
- Manage EAB budget
